SOIL HEALTH REPORT

Warangal | North Field — 1.6 ha

Analysis #68 2026-08-11 20:38:56 — Warangal

SOIL HEALTH SCORE

54.0 / 100 POOR

DEGRADATION RISK

0.46 MODERATE

NUTRIENT LEVELS

Nitrogen (N)	**55.0 index**	ADEQUATE
Phosphorus (P)	**22.0 index**	LOW
Potassium (K)	**45.0 index**	ADEQUATE
pH	**5.9**	ACIDIC

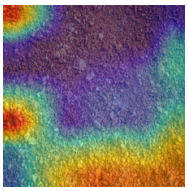

organic matter: 0.68% moisture: 22.0%

SOIL TYPE (FROM PHOTO)

Alluvial 99.2% confidence

model reliability: unknown | next best: Laterite (1%)

All 4 test errors occurred on the Alluvial/Laterite boundary (recall: Alluvial 0.91, Laterite 0.96). Confirm 'Alluvial' against local knowledge before acting on it.

Grad-CAM - focus: middle-left

WHAT TO APPLY

DAP 183.1 kg total

basal day 0: 91.5 kg | top dress 1 day 30: 45.8 kg | top dress 2 day 60: 45.8 kg

Compost 8000.0 kg total

basal day 0: 8000.0 kg

Lime 2000.0 kg/ha

pH 5.9 is slightly acidic - 2-4 weeks before sowing

BEST-SUITED CROPS

Pomegranate	**88% excellent**
Rice	**80% good**
Watermelon	**73% good**
Muskmelon	**69% moderate**
Mango	**69% moderate**

LONG-TERM TREND DECLINING

Soil health is falling by about 15.8 points per record. At this rate the field moves toward the critical band.

Reaches critical in about 1 season(s) if unchanged.

Rates are indicative and assume a medium-textured soil. Calibrate against local ICAR / Soil Health Card recommendations before acting.

The soil health score derives from laboratory soil chemistry. Soil type predicted from the photograph never changes the score; it can adjust nutrient thresholds only when the model is confident enough, as noted above.
